Game Implementation Techniques

Lecture 3

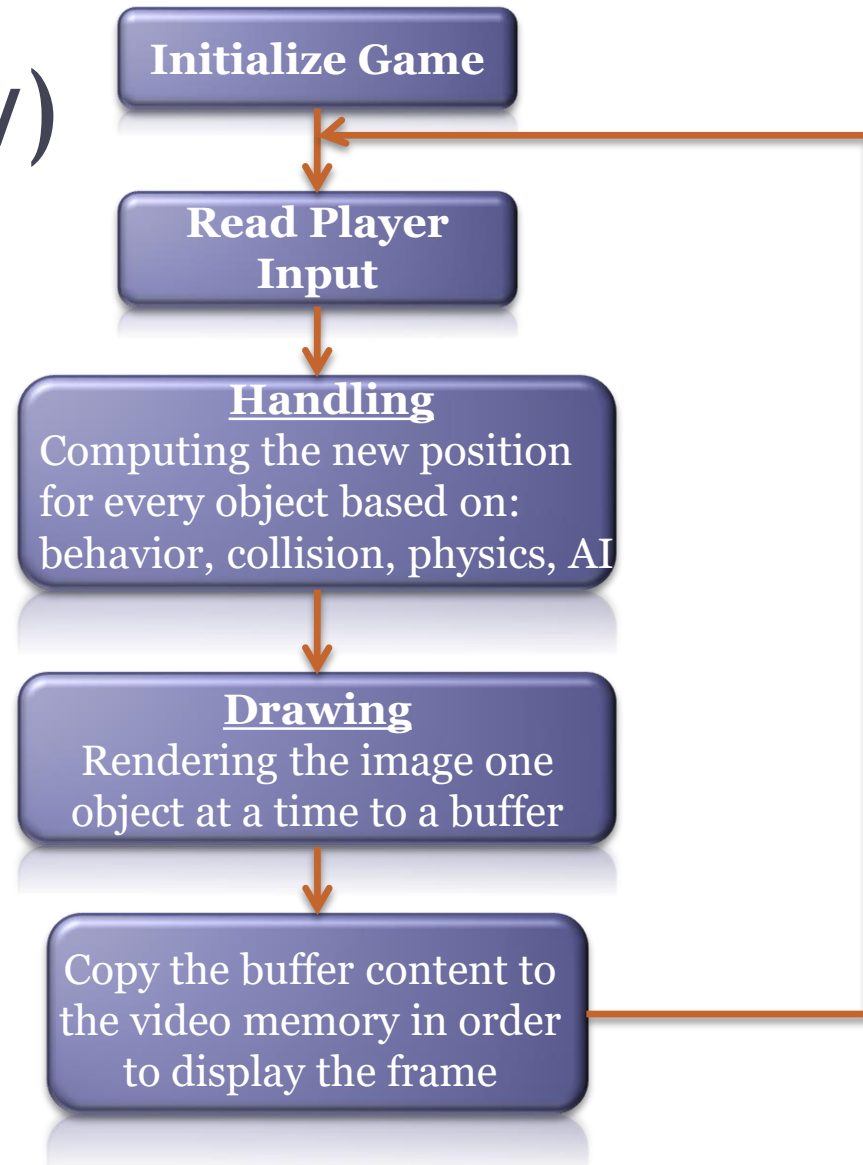

Questions?

- Game Engine Components
 - System Components
 - Game Logic Components

Overview

- Game State Manager
- Function Pointers

Game Loop (Review)

Game State Manager (GSM) (1 / 2)

- A game is always in a state. A game could be in “Main Menu”, in “Level 1”, in “Loading screen”...
- The GSM is responsible for game state switching, the game loop and the frame rate controller.
- Each state is associated with a set of functions that manages that state's cycle.

Game State Manager (GSM) (2/2)

- The cycle functions are:
 - Load
 - Initialize
 - Update
 - Draw
 - Free
 - Unload

Cycle Functions: Load

- Loads the state's necessary data and initializes it.
- It is called once at the start of the state.
- It should NOT be called upon restarting a state.

Cycle Functions: Initialize

- Used to prepare the state's data in order to be used for the first time.
- It loads no data whatsoever.
- If a state is restarted, this cycle function is used.

Cycle Functions: Update & Draw

- Update:
 - Updates the state's data, based on several factors like user input, time or gameplay logic...
- Draw:
 - Sends data to the graphics engine component

Cycle Functions: Free

- Used to clean up the state.
- Make the state ready to be unloaded or initialized again.
- No data is dumped in this cycle function

Cycle Functions: Unload

- Is called when the state should be terminated.
- It dumps back all the data that was loaded in the state's load cycle function.

Overview

- Game State Manager
- **Function Pointers**

Pointers to Functions

Check Uploaded Snippet Files ([Pointers to Functions - VS.zip](#)):

- Pointer to a function – Snippet 1
- Array of function pointers – Snippet 2
- Using typedef with function pointers – Snippet 3
- Passing function pointers as arguments – Snippet 4
- Returning function pointers – Snippet 5
