

Goh Wei Zhe A6 Reflection

Through CS397 Embedded Systems Module, I learnt how to integrate embedded solutions with microcontrollers with peripheral device such as displaying messages / data on LED matrix as a continuous message and digital clock timers.

Embedded System isn't easy. It requires a lot of time to reading to understand what each register does, etc. It also requires very good knowledge of bit and bytes which I didn't have a good foundation of it. Therefore, I had many troubles implementing it.

This module made me understand how to devices are being implemented as well as the difficulty of doing it.
