Each iteration for fork() in while-loop statement decrease Count by one each time so total 3 threads are created and there are 3 iterations when the result for testing Count==0 is false.

Each time after runs fork() in while-statement, fork()||fork() statement run once,

regardless of fork() in while statement being True or False. fork() in while statement run 3 times (create one child process).

Please note that each fork()||fork() creates 3 processes.

So there are 9 child processes (excluding 1st parent) created.
